EECS 183 Lab 6
Free Response Practice

File I/O. Write a C++ program that
- asks the user for a filename, and then
- counts the words in that file and
- prints the word count.

You can assume that the file will always end in a blank line.

As an example, suppose essay.txt contained this text:

```
Mark Z.
EECS 183

Hello world!
```

The program would behave per the sample output below, where user's input is underlined:

```
Filename: essay.txt
Word count: 6
```

Write your solution on the next page.

```cpp
#include <iostream>
#include <fstream>
#include <string>
using namespace std;

int main() {

    return 0;
}
```
